

Readers Writers

➡ allow multiple readers but only one writer in the critical section

```
void writer () {  
    while(1) {  
        write(file, data);  
    }  
}
```

```
void reader () {  
    while(1) {  
        data:= read(file);  
    }  
}
```

Solution

1. **readcount** (variable) to keep track of the number of readers currently reading
2. **mutex** (binary semaphore) to synchronize the access to readcount
3. **writer_or_readers** (binary semaphore) to provide exclusive access to each writer or all readers
 - writer should wait before writing and signal after
 - readers should wait when readcount goes from 0 to 1 and signal when readcount goes from 1 to 0
